European Technical Assessment

ETA-10/0309 of 01/10/2015

English translation prepared by CSTB - Original version in French language

General Part

Technical Assessment Body issuing the ETA and designated according to Article 29 of the Regulation (EU) No 305/2011:

Nom commercial *Trade name*	**Injection system SPIT EPCON C8 XTREM for cracked concrete**
Famille de produit *Product family*	**Cheville à scellement de type "à injection" pour fixation dans le béton fissuré et non fissuré : tiges filetées M8 à M30 et barres d'armatures Ø8 à Ø32.** ***Bonded injection type anchor for use in cracked and non-cracked concrete: Threaded rods M8 to M30 and rebars Ø8 to Ø32***
Titulaire *Manufacturer*	Société SPIT Route de Lyon F-26501 BOURG-LES-VALENCE France
Usine de fabrication *Manufacturing plant*	Société SPIT Route de Lyon F-26501 BOURG-LES-VALENCE France
Cette evaluation contient: *This Assessment contains*	25 pages incluant 21 pages d'annexes qui font partie intégrante de cette évaluation *25 pages including 21 pages of annexes which form an integral part of this assessment*
Base de l'ETE *Basis of ETA*	ETAG 001, Version April 2013, utilisée en tant que EAD *ETAG 001, Edition April 2013 used as EAD*
Cette evaluation remplace: *This Assessment replaces*	ATE-10/0309 valide du 11/10/2010 au 11/10/2015 ETA-10/0309 with validity from 11/10/2010 to 11/10/2015

Specific part

1 Technical description of the product

The Injection system SPIT EPCON C8 XTREM is an adhesive anchor consisting of a two component system delivered in unmixed condition in cartridges and of a steel element.

The steel element can be made of zinc plated carbon steel, reinforcing bar, stainless steel, or high corrosion resistant stainless steel (HCR).

The steel element is placed into a rotary/percussion drilled hole filled with the injection mortar and is anchored via the bond between the metal part and concrete.

An illustration of the product is provided in Annexes A.

2 Specification of the intended use

The performances given in Section 3 are only valid if the anchor is used in compliance with the specifications and conditions given in Annexes B.

The provisions made in this European Technical Assessment are based on an assumed working life of the anchor of 50 years. The indications given on the working life cannot be interpreted as a guarantee given by the producer, but are to be regarded only as a means for choosing the right products in relation to the expected economically reasonable working life of the works.

3 Performance of the product

3.1 Mechanical resistance and stability (BWR 1)

Essential characteristic	Performance
Characteristic resistance under tension loads in non-cracked concrete acc. TR029 or CEN/TS 1992-4, for threaded rods	See Annex C1
Characteristic resistance under tension loads in cracked concrete acc. TR029 or CEN/TS 1992-4, for threaded rods	See Annex C2
Characteristic resistance under shear loads in concrete acc. TR029 or CEN/TS 1992-4, for threaded rods	See Annex C 3
Displacements for threaded rods	See Annex C4
Characteristic resistance under tension loads in non-cracked concrete acc. TR029 or CEN/TS 1992-4, for rebars	See Annex C5
Characteristic resistance under tension loads in cracked concrete acc. TR029 or CEN/TS 1992-4, for rebars	See Annex C6
Characteristic resistance under shear loads in concrete acc. TR029 or CEN/TS 1992-4, for rebars	See Annex C7
Displacements for rebars	See Annex C8
Characteristic resistance under seismic action C1 acc. TR045, for threaded rods	See Annex C11

3.2 Safety in case of fire (BWR 2)

Essential characteristic	Performance
Reaction to fire	Anchorages satisfy requirements for Class A1
Resistance to fire	No performance determined (NPD)

3.3 Hygiene, health and the environment (BWR 3)

Regarding dangerous substances contained in this European Technical Assessment, there may be requirements applicable to the products falling within its scope (e.g. transposed European legislation and national laws, regulations and administrative provisions). In order to meet the provisions of the Construction Products Directive, these requirements need also to be complied with, when and where they apply.

3.4 Safety in use (BWR 4)

For Basic requirement Safety in use the same criteria are valid as for Basic Requirement Mechanical resistance and stability.

3.5 Protection against noise (BWR 5)

Not relevant.

3.6 Energy economy and heat retention (BWR 6)

Not relevant.

3.7 Sustainable use of natural resources ((BWR 7)

For the sustainable use of natural resources no performance was determined for this product.

3.8 General aspects relating to fitness for use

Durability and Serviceability are only ensured if the specifications of intended use according to Annex B1 are kept.

4 Assessment and verification of constancy of performance (AVCP)

According to the Decision 96/582/EC of the European Commission [1], as amended, the system of assessment and verification of constancy of performance (see Annex V to Regulation (EU) No 305/2011) given in the following table apply.

Product	Intended use	Level or class	System
Metal anchors for use in concrete	For fixing and/or supporting to concrete, structural elements (which contributes to the stability of the works) or heavy units	—	1

5 Technical details necessary for the implementation of the AVCP system

Technical details necessary for the implementation of the Assessment and verification of constancy of performance (AVCP) system are laid down in the control plan deposited at Centre Scientifique et Technique du Bâtiment.

The manufacturer shall, on the basis of a contract, involve a notified body approved in the field of anchors for issuing the certificate of conformity CE based on the control plan.

Table A2: Material properties for rebars

(Refer to EN 1992-1-1 Annex C Table C.1 and C.2N)

Product form		**Bars and de-coiled rods**	
Class		B	C
Characteristic yield strength f_{yk} or $f_{0,2k}$ (MPa)		400 to 600	
Minimum value of $k = (f_t/f_y)_k$		≥ 1,08	≥ 1,15 < 1,35
Characteristic strain at maximum force, ε_{uk} (%)		≥ 5,0	≥ 7,5
Bendability		Bend / Rebend test	
Maximum deviation from nominal mass (individual bar or wire) (%)	Nominal bar size (mm) ≤ 8 > 8	 ± 6,0 ± 4,5	
Minimum relative rib area, $f_{R,min}$ (mm^2)	Nominal bar size (mm) 8 to 12 > 12	 0,040 0,056	

High of the rib h_{rib}:

The high of the rib h_{rib} must satisfy the equation $0{,}05\ d \leq h_{rib} \leq 0{,}07\ d$
with d = nominal diameter of the rebar.

SPIT EPCON C8 XTREM	**Annex A5**
Product description Rebars	

Specifications of intended use

Anchorages subject to:

- Static and quasi-static loads.
- Seismic loads (performance categories C1 for threaded rods of sizes M10, M12 and M16),

Base materials:

- Cracked concrete and non-cracked concrete.
- Reinforced or unreinforced normal weight concrete of strength classes C20/25 at least to C50/60 at most according to EN 206-1: 2000-12.

Temperature Range:

- Ta: - 40°C to +40°C (max. short term temperature +40°C and max. long term temperature +24°C)
- Tb: - 40°C to +80°C (max. short term temperature +80°C and max. long term temperature +50°C)

Use conditions (Environmental conditions):

- Structures subject to dry internal conditions (zinc coated steel, stainless steel, high corrosion resistance steel).
- Structures subject to permanently damp internal condition, if no particular aggressive conditions exist (stainless steel, high corrosion resistance steel).
- Structures subject to external atmospheric exposure including industrial and marine environment if no particular aggressive conditions exist (stainless steel, high corrosion resistance steel).
- Structures subject to any of the three above conditions, with particular aggressive conditions (high corrosion resistance steel).

Note: Particular aggressive conditions are e.g. permanent, alternating immersion in seawater or the splash zone of seawater, chloride atmosphere of indoor swimming pools or atmosphere with extreme chemical pollution (e.g. in desulphurization plants or road tunnels where de-icing materials are used).

Design:

- The anchorages are designed in accordance with the EOTA Technical Report TR 029 "Design of bonded anchors" or CEN/TS 1992-4-5" Design of fastenings for use in concrete" under the responsibility of an engineer experienced in anchorages and concrete work.
- For seismic applications the anchorages are designed in accordance with TR045 "Design of Metal Anchors For Use In Concrete Under Seismic Actions".
- Verifiable calculation notes and drawings are prepared taking account of the loads to be anchored. The position of the anchor is indicated on the design drawings.

Installation:

- Dry or wet concrete (use category 1) and in flooded holes (use category 2).
- Installation in cracked concrete for all sizes of threaded rods and rebars.
- All the diameters may be used in all the direction (floor, wall, overhead).
- Anchor installation carried out by appropriately qualified personnel and under the supervision of the person responsible for technical matters of the site.
- Use of the anchor only as supplied by the manufacturer without exchanging the components of an anchor.
- Anchor installation in accordance with the manufacturer's specifications and drawings and using the appropriate tools (Annexes B2 to B5).
- Effective anchorage depth, edge distances and spacing not less than the specified values without minus tolerances.
- Hole drilling by hammer drill
- In case of aborted drill hole: the drill hole shall be filled with mortar.

- For overhead installation, piston plugs shall be used, embedded metal parts shall be fixed during the curing time, e.g. with wedges.

Note:

Rebars may be used as anchor designed in accordance with the EOTA Technical Report TR 029 only. The basic assumptions for the design according to anchor theory shall be observed. This includes the consideration of tension and shear loads and the corresponding failure modes as well as the assumption that the base material (concrete structural element) remains essentially in the serviceability limit state (either non-cracked or cracked) when the connection is loaded to failure. Such applications are e.g. concrete overlay or shear dowel connections or the connections of a wall predominantly loaded by shear and compression forces with the foundation, where the rebars act as dowels to take up shear forces.

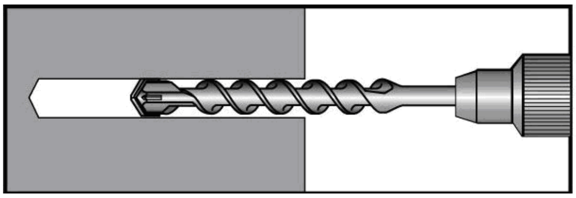
Installation instruction

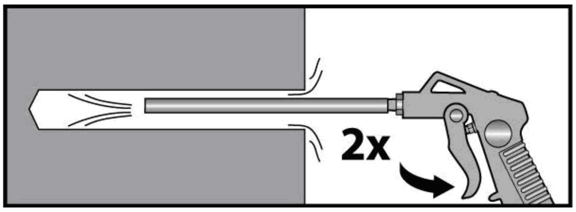
Bore hole drilling

1 Drill hole of diameter (d_0) and depth (h_0) with a hammer drill set in rotation-hammer mode using an appropriately carbide drill bit.

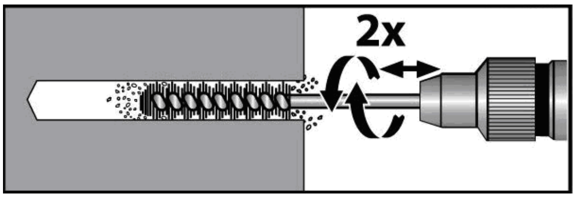


Bore hole cleaning

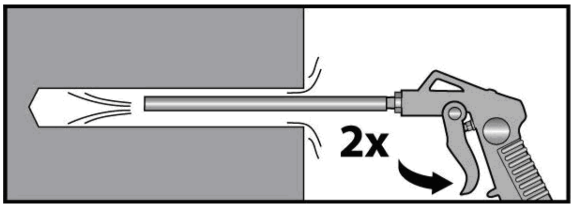
2 Using compress air cleaning (mini 6 bars), use the appropriate extension and air nozzle, starting from the bottom of the hole blow out at least 2 times and until no dust is evacuated



3 Using the relevant SPIT brush and extension fitted on a drilling machine (brush dimensions in Tables B2), starting from the top of the hole in rotation, move downward to the bottom of the hole then move upward to the top of the hole. Repeat this operation.

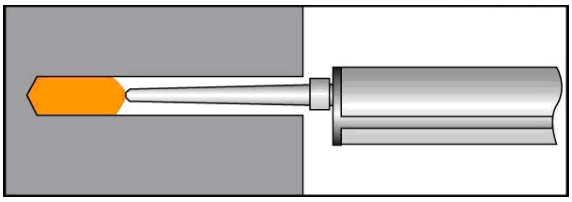


4 Using compress air cleaning (mini 6 bars), use the appropriate extension and air nozzle, starting from the bottom of the hole blow out at least 2 times and until no dust is evacuated.

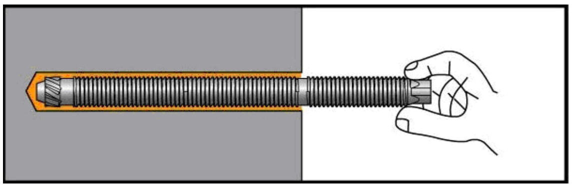


Injection

5 Screw the mixing nozzle onto the cartridge and dispense the first part to waste until an even colour is achieved for each new cartridge or mixing nozzle. Use tube extensions for holes deeper than 250 mm. Starting from the bottom of the hole, fill uniformly. In order to avoid air pocket, withdraw slowly the mixing nozzle while injecting the resin. Fill the hole until 1/2 full. For hole deeper than 350mm use piston plug.



6 Insert the rod or rebar, slowly and with a slight twisting motion in respect of the gel time indicated in Table B3. Remove excess resin from around the mouth of the hole before it sets. Control the embedment depth.



Setting the element

Do not disturb anchor before specified cure time (acc. to Table B3)
Attach the fixture and tighten the nut at the specified torque (Table B1a)

[1)] Calculation of displacement under shear load: V_{Sd} design value of shear load.
Displacement under short term loading = $\delta_{V0} \cdot V_{Sd} / 1,4$
Displacement under long term loading = $\delta_{V\infty} \cdot V_{Sd} / 1,4$

The seismic performance of anchors subjected to seismic loading is categorized by performance categories C1 and C2. Seismic performance category C1 provides anchor capacities only in terms of resistances at ultimate limit state, while seismic performance category C2 provides anchor capacities in terms of both resistances at ultimate limit state and displacements at damage limitation state and ultimate limit state.

Table C11 relates the seismic performance categories C1 and C2 to the seismicity level and building importance class. The level of seismicity is defined as a function of the product $a_g \cdot S$, where a_g is the design ground acceleration on Type A ground and S the soil factor both in accordance with EN 1998-1.

The value of a_g or that of the product $a_g \cdot S$ used in a Member State to define thresholds for the seismicity classes may be found in its National Annex of EN 1998-1 and may be different to the values given in Table C11. Furthermore, the assignment of the seismic performance categories C1 and C2 to the seismicity level and building importance classes is in the responsibility of each individual Member State.

Table C11: Recommended seismic performance categories for metal anchors

Seismicity level [a]		**Importance Class acc. to EN 1998-1:2004, 4.2.5**			
Class	$a_g \cdot S$ [c]	**I**	**II**	**III**	**IV**
Very low [b]	$a_g \cdot S \leq 0,05\ g$	No additional requirement			
Low [b]	$0,05\ g < a_g \cdot S \leq 0,10\ g$	C1	C1 [d] or C2 [e]		C2
> low	$a_g \cdot S > 0,10\ g$	C1	C2		

a The values defining the seismicity levels are may be found in the National Annex of EN 1988-1.

b Definition according to EN 1998-1:2004, 3.2.1.

c a_g = design ground acceleration on Type A ground (EN 1998-1:2004, 3.2.1),
S = soil factor (see e.g. EN 1998-1:2004, 3.2.2).

d C1 for Type 'B' connections (see TR045 §5.1) for fixings of non-structural elements to structures

e C2 for Type 'A' connections (see TR045 § 5.1) for fixings structural elements to structures

Table C12: Reduction factor α_{seis}

Loading	Failure mode	α_{seis}- Single anchor [1)]	α_{seis}- Anchor Group
Tension	Steel failure	1,0	1,0
	Pull-out failure	1,0	0,85
	Concrete cone failure	0,85	0,75
	Splitting failure	1,0	0,85
Shear	Steel failure	1,0	0,85
	Concrete edge failure	1,0	0,85
	Concrete pry-out failure	0,85	0,75

[1)] In case of tension loading single anchor also addresses situations where only ONE anchor in a group of anchors is subjected to tension.

The seismic design shall be carried out according to TR045 Technical Report "Design of metal anchors for use in concrete under seismic actions". The characteristic seismic resistance $R_{k,seis}$ ($N_{Rk,seis}$, $V_{Rk,seis}$) of a fastening shall be calculated for each failure mode as follows :

$$R_{k,seis} = \alpha_{gap} \cdot \alpha_{seis} \cdot R^0_{k,seis}$$

where

α_{gap} Reduction factor to take into account inertia effects due to an annular gap between anchor and fixture in case of shear loading;
= 1.0 in case of no hole clearance between anchor and fixture;
= 0.5 in case of connections with standard hole clearance acc. TR 029 Table 4.1.

α_{seis} Reduction factor to take into account the influence of large cracks and scatter of load/displacement curves, see Table C12;

$R^0_{k,seis}$ Basic characteristic seismic resistance for a given failure mode :

For steel and pull-out failure under tension load and steel failure under shear load, $R^0_{k,seis}$ (i.e. $N_{Rk,s,seis}$, $N_{Rk,p,seis}$, $V_{Rk,s,seis}$) shall be taken from :
- Annex C11 for performance category C1

For all other failure modes $R^0_{k,seis}$ shall be determined as for the design situation for static and quasi-static loading according to ETAG 001, Annex C (i.e. $N_{Rk,c}$, $N_{Rk,sp}$, $V_{Rk,c}$, $V_{Rk,cp}$).

Table C13: Characteristic resistances in case of seismic performance category C1 acc. TR045 "Design of Metal anchor under Seismic Actions"

Threaded rods			M8	M10	M12	M16	M20	M24	M30
Tension loads									
Steel failure									
Seismic reduction factor	$\alpha_{N,seis}$	[-]	-	**1,0**			-	-	-

Characteristic resistance "Stainless steel A4"	$V_{Rk,s,seis}$	[kN]	-	14	21	38,5	-	-	-
Partial safety factor	$\gamma_{Ms,seis}$ 1)	[-]	1,56						2,38
Characteristic resistance "Stainless steel HCR"	$V_{Rk,s,seis}$	[kN]	-	13,3	18,9	35,7	-	-	-
Partial safety factor	$\gamma_{Ms,seis}$ 1)	[-]	2,17						

1) In absence of other national regulations.
2) Explanation see Annex B1.
3) The partial safety factor γ_2 = 1,2 is included.
4) The partial safety factor γ_2 = 1,4 is included.

*) Tests and assessment yield $\alpha_{V,seis}$ = [0,71 / 0,80 / 0, 7]. However, from Oct. 2014 (doc. 805), EOTA Expert Group for anchors does not allow $\alpha_{V,seis}$ > 0,7 for anchors using commercial standard rods.

The definition of seismic performance category C1 is given in Annex C9.
